

# Statistical Methods for Data Science: A Starter Kit

Yinan Yu

yinan@chalmers.se/yinan.yu@asymptotic.ai

## Statistical Data Type (11)

**Categorical data:** labels or tags

- Nominal: unordered labels, e.g. species of ducks
- Ordinal: ordered labels, e.g. {"duckling", "teen duck", "adult duck"}

**Numerical data:**

- Discrete (interval): countable, e.g. integers; numbers of ducks
- Continuous (ratio): uncountable, e.g. real values; weights of ducks

## Data Container (11)

**Array (tensor):**

- Scalar, vector, matrix, higher order array
- Same numerical data type
- Python library: numpy

**Table:**

- Described by columns and rows
- Mixed data types
- Python library: pandas

## Descriptive Statistics: numerical data (11)

Data set (a sample): numerical data  $x_1, \dots, x_N$

**Centrality:**

- sample mean:  $\bar{x} = \frac{1}{N} \sum_{i=1}^N x_i$
- median: sort  $x_i$  and median is the value in the middle
- mode (discrete values): the most frequent value in a sample

**Dispersion:**

- min, max, range:  $\min\{x_i\}, \max\{x_i\}, \max\{x_i\} - \min\{x_i\}$
- quantiles/percentiles: given  $p \in (0, 1)$ ,  $q$  is a  $p$ -quantile of the data if  $p \times 100\%$  of the data are smaller than  $q$

- sample variance:  $s^2 = \frac{1}{N-1} \sum_{i=1}^N (x_i - \bar{x})^2$
- sample standard deviation:  $s$

**Dependence:** given a data set with two paired values:

$$\{(x_1, y_1), (x_2, y_2), \dots, (x_N, y_N)\}$$

- covariance:

$$\text{cov}(x, y) = \frac{1}{N-1} \sum_{i=1}^N (x_i - \bar{x})(y_i - \bar{y})$$

- correlation: measures how close data is to a linear relationship

$$\text{corr}(x, y) = \frac{\text{cov}(x, y)}{\sigma_x \sigma_y}, \quad -1 \leq \text{corr}(x, y) \leq 1$$

## Descriptive Statistics: categorical data (11)

Data set (a sample): categorical data  $x_1, \dots, x_N$

- Count/frequency
- Transformed into numerical, discrete data

## Visualization: numerical data (11)

- Distribution:

– Histogram/normalized histogram 

– Kernel density estimator 

– Box plot 

- Dependence (two variables):

– Scatter plot 

– Heat map for covariance/correlation 

## Visualization: categorical data (11)

- Distribution

– Bar chart 

– Pie chart 

- Dependence

– Mosaic plot 

## Probability distribution (12)

- Experiment: an action that leads to one outcome
- Sample space: the set of all possible outcomes from an experiment
- Event: a subset of the sample space
- Random variable (discrete/continuous): assigning a numerical value to each outcome of the experiment; denoted by capital letters, e.g.  $X$
- Probability distribution: the probability of the occurrence of *any* event in the sample space; can be described by  $P(\text{event})/\text{PDF}/\text{PMF}/\text{CDF}$ 
  - $P(\text{event})$ : the probability of an event occurring
  - PDF  $f(x)$ : the probability density function for continuous random variables;  $\int_{-\infty}^{+\infty} f(x)dx = 1$
  - PMF  $f(x)$ : the probability mass function for discrete random variables;  $\sum_{x=-\infty}^{+\infty} f(x) = 1$
  - CDF  $F(x)$ : the cumulative density function;  $F(x) = P(X \leq x)$
- Quantile function  $Q$ : the inverse CDF, i.e.
$$F_X(Q(p)) = p \text{ and } Q(F_X(q)) = q$$
- Conditional probability
- Independent and identically distributed (i.i.d.) random variables

## Examples (12)

Discrete/continuous, PMF/PDF, parameters, typical use cases (statistical data type, example scenarios)

- Bernoulli distribution 

- Categorical distribution 

- Binomial distribution (18) 

- Discrete uniform 

- Gaussian distribution 

Generalize this learning routine to unknown distributions

## Properties of Gaussian distributions (16)

- Let  $X \sim \mathcal{N}(\mu_X, \sigma_X^2)$  be a Gaussian random variable, then the following random variables are also Gaussian
  - Scaling:  $tX \sim \mathcal{N}(t\mu_X, t^2\sigma_X^2)$ ,  $t \neq 0$  is a constant
  - Translation:  $X + c \sim \mathcal{N}(\mu_X + c, \sigma_X^2)$ ,  $c$  is a constant
  - $tX + c \sim \mathcal{N}(t\mu_X + c, t^2\sigma_X^2)$
- Let  $X \sim \mathcal{N}(\mu_X, \sigma_X^2)$  and  $Y \sim \mathcal{N}(\mu_Y, \sigma_Y^2)$  be two **independent** Gaussian random variables, then the following random variables are also Gaussian
  - $X + Y \sim \mathcal{N}(\mu_X + \mu_Y, \sigma_X^2 + \sigma_Y^2)$
  - $X - Y \sim \mathcal{N}(\mu_X - \mu_Y, \sigma_X^2 + \sigma_Y^2)$

## Bayes' rule (14, 15)

- Parameter estimation:

$$f_{\Theta|data}(\theta | data) = \frac{\overbrace{f_{data|\Theta}(data | \theta)}^{\text{likelihood}} \overbrace{f_{\Theta}(\theta)}^{\text{prior}}}{f_{data}(data)}$$

where  $f(\cdot)$  is the PDF/PMF

- Multinomial naive Bayes classifier:

$$P(Y = y | X = x) = \frac{\overbrace{P(X = x | Y = y)}^{\text{likelihood}} \overbrace{P(Y = y)}^{\text{prior}}}{P(X = x)}$$

- Gaussian naive Bayes classifier/Gaussian mixture models:

$$P(Y = y | X = x) = \frac{\overbrace{f_{X|Y=y}(x | Y = y)}^{\text{likelihood}} \overbrace{P(Y = y)}^{\text{prior}}}{f_X(x)}$$

## Q-Q plot (13)

- Use cases:
  - Compare a data distribution to a theoretical distribution (one sample test)
  - Compare two data distributions (two sample test)
- Steps:
  - Choose a set of  $m$  probabilities  $p_1, \dots, p_m \in [0, 1]$  (make sure they spread evenly between 0 and 1)
  - For  $i = 1, 2, \dots, m$ :
    - \* Compute the quantile  $q_i^1$  of the first distribution at  $p_i$
    - \* Compute the quantile  $q_i^2$  of the second distribution at  $p_i$
    - \* Make a scatter plot of the pair  $(q_i^1, q_i^2)$
- Interpretation
  - Case 1: if the two distributions are identical, the points in the Q-Q plot should follow a 45° straight line  $y = x$
  - Case 2: if the two distributions are linearly related, the points in the Q-Q plot follow a straight line that is not necessarily  $y = x$
  - Case 3: if the two distributions are from different families of distributions, the points in the Q-Q plot are not lying on a straight line.

## Mathematical Modeling (13)

$$y = g(x; \theta | h)$$

1. What do we want to predict, i.e. what is the target  $y$ ?
2. What are the variables  $x$ ?
3. What is the mathematical function  $g$  that relates variables  $x$  to the target  $y$ ?
4. Are there any hyperparameters  $h$  in the function  $g$ ? How do we choose them?
5. What are the unknown parameters  $\theta$  in  $g$ ? **How do we estimate them from data?**

## Parameter estimation (14)

- Maximum likelihood estimation: frequentist approach -  **$\theta$  is deterministic**
- Maximum A Posteriori estimation: Bayesian approach -  **$\theta$  is probabilistic**

## Maximum Likelihood Estimation (14)

Given a model  $y = g(x; \mathcal{O} \mid h)$ , where  $\mathcal{O}$  is a set of parameters

- Describe the experiments
- Describe the data generated from the experiments
- Describe the random variables (typically with i.i.d. assumption)
- Choose a parameter of interest  $\theta \in \mathcal{O}$
- Choose the maximum likelihood estimation as the estimation method:

Given data  $x_1, \dots, x_N$  and assume i.i.d. random variables  $X_i$  with PDF/PMF  $f(x_i)$ ,

$$L(\theta \mid x_1, \dots, x_N) = \prod_{i=1}^N f(x_i; \theta)$$

- Compute  $\hat{\theta}_{MLE}$  by maximizing the likelihood function:

$$\begin{aligned} \hat{\theta}_{MLE} &= \arg \max_{\theta} L(\theta \mid x_1, \dots, x_N) \\ &= \arg \max_{\theta} \prod_{i=1}^N f(x_i; \theta) \end{aligned}$$

or equivalently, minimizing the **negative log likelihood function**:

$$\hat{\theta}_{MLE} = \arg \min_{\theta} - \sum_{i=1}^N \log(f(x_i; \theta))$$

- Simple case, e.g. i.i.d. Gaussian, find the closed-form solution by:
  - Taking the partial derivative with respect to the parameter
  - Setting the derivative to zero
  - Solving for the parameter
- In general, the estimate needs to be found by iterative methods, e.g. gradient descent

## Maximum A Posteriori Estimation (14)

Given a model  $y = g(x; \mathcal{O} \mid h)$ , where  $\mathcal{O}$  is a set of parameters

- Describe the experiments
- Describe the data generated from the experiments
- Describe the random variables (typically with i.i.d. assumption)
- Choose a parameter of interest  $\theta \in \mathcal{O}$
- Choose the maximum a posteriori estimation as the estimation method

- $\theta$  is assumed to be drawn from a random distribution**
- Choose a prior distribution for  $\theta$  along with the hyperparameters:  $f_{\Theta}(\theta)$ 
  - Prior might be known by the problem setup
  - If prior unknown, conjugate priors are typically chosen for various reasons
- Find the likelihood function:  $f_{X|\Theta}(\mathbf{x} \mid \theta)$  (same as in MLE)
- Express the posterior distribution in terms of the prior and the likelihood function

$$f_{\Theta|X}(\theta \mid \mathbf{x}) = \frac{f_{X|\Theta}(\mathbf{x} \mid \theta) f_{\Theta}(\theta)}{f_X(\mathbf{x})}$$

- Compute  $\hat{\theta}_{MAP}$  by maximizing the posterior function (or equivalently, minimizing the negative log posterior function without the normalization constant). The optimal solution can be found by a closed-form expression or using iterative techniques.

## Standardization (16)

**Standardization**: let  $X$  be a random variable that follows **any probability distribution** with mean  $\mu$  and standard deviation  $\sigma$ . The standardization of  $X$  is

$$Y = \frac{X - \mu}{\sigma}$$

## Central limit theorem (16)

Given an i.i.d. sample  $X_1, X_2, \dots, X_N$  from **ANY probability distribution** with *finite mean  $\mu$  and variance  $\sigma^2$*  (most distributions satisfy this!), when the sample size  $N$  is sufficiently large, the **sample mean** approximately follows a Gaussian distribution with mean  $\mu$  and variance  $\frac{\sigma^2}{N}$ , i.e.

$$\bar{X} \sim \mathcal{N}(\mu, \frac{\sigma^2}{N})$$

## Confidence interval (16)

- **Data:**  $x_1, \dots, x_N$
- **Random variable:**  $X_1, \dots, X_N$  with i.i.d. assumption
- **Parameter of interest:**  $\theta$ , e.g. the mean  $\mu$
- **Estimate:**  $\hat{\theta}$ , e.g. the sample mean  $\bar{x}$
- **Confidence interval** for a given confidence level  $1 - \alpha$  (e.g. 95%)

– Definition:

$$\text{confidence interval} = (\hat{\theta} - \text{margin of error}, \hat{\theta} + \text{margin of error})$$

where

$$\text{margin of error} = \text{critical value} \times \text{standard error of } \hat{\theta}$$

– Calculation:

| Distribution of $X_i$ | Scenario         | $\theta$ | $\hat{\theta}$ ( <b>sampling distribution</b> ) | Critical value               | Standard error                         | Confidence interval                                                                                                                               | Note                         |
|-----------------------|------------------|----------|-------------------------------------------------|------------------------------|----------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------|------------------------------|
| i.i.d. Gaussian       | $\sigma$ known   | mean     | sample mean $\bar{x}$                           | $z_{\alpha/2}$               | $\frac{\sigma}{\sqrt{N}}$              | $\left(\bar{x} - z_{\alpha/2} \frac{\sigma}{\sqrt{N}}, \bar{x} + z_{\alpha/2} \frac{\sigma}{\sqrt{N}}\right)$                                     | exact                        |
|                       | $\sigma$ unknown |          | ( <b>Gaussian distribution</b> )                | $t_{\alpha/2}$               | $\frac{s}{\sqrt{N}}$                   | $\left(\bar{x} - t_{\alpha/2} \frac{s}{\sqrt{N}}, \bar{x} + t_{\alpha/2} \frac{s}{\sqrt{N}}\right)$                                               |                              |
| i.i.d.                | $\sigma$ known   |          | sample mean $\bar{x}$                           | $z_{\alpha/2}$               | $\frac{\sigma}{\sqrt{N}}$              | $\left(\bar{x} - z_{\alpha/2} \frac{\sigma}{\sqrt{N}}, \bar{x} + z_{\alpha/2} \frac{\sigma}{\sqrt{N}}\right)$                                     | approximate<br>for large $N$ |
|                       | $\sigma$ unknown |          | ( <b>approximately Gaussian under CLT</b> )     | $t_{\alpha/2}$               | $\frac{s}{\sqrt{N}}$                   | $\left(\bar{x} - t_{\alpha/2} \frac{s}{\sqrt{N}}, \bar{x} + t_{\alpha/2} \frac{s}{\sqrt{N}}\right)$                                               |                              |
| i.i.d.                | -                | any      | MLE ( <b>asymptotically Gaussian</b> )          | $z_{\alpha/2}$               | $\frac{1}{\sqrt{N I_N(\hat{\theta})}}$ | $\left(\hat{\theta} - z_{\alpha/2} \frac{1}{\sqrt{N I_N(\hat{\theta})}}, \hat{\theta} + z_{\alpha/2} \frac{1}{\sqrt{N I_N(\hat{\theta})}}\right)$ | asymptotic                   |
| i.i.d.                | -                | any      | any statistic ( <b>any distribution</b> )       | bootstrap the error quantile |                                        | $\left(\hat{\theta} - \epsilon_{1-\alpha/2}, \hat{\theta} - \epsilon_{\alpha/2}\right)$                                                           | approximate                  |

where  $\sigma$  is the standard deviation of the  $X_i$  and  $s$  the sample standard deviation

## Hypothesis testing steps (17)

- Step 1 Make a “boring” statement
- Step 2 Design an **experiment**
- Step 3 Describe the **data** generated from the experiment and the corresponding random variables
- Step 4 Describe the parameter of interest and their estimates
- Step 5 Translate the “boring” statement into a statistical hypothesis and call it the **null hypothesis**  $H_0$
- Step 6 Find the expression for the **test statistic**  $s$
- Step 7 Find the expression for the **null distribution**
- Step 8 Define an **alternative hypothesis**  $H_A$ : one-tailed or two-tailed
- Step 9 Choose a **significance level**  $\alpha$  (the tail), which defines the **rejection region**
- Step 10 Collect **data**
- Step 11 Compute the test statistic from data
- Step 12 Compute the  $p$ -value
- Step 13 If  $p\text{-value} < \alpha$ , i.e. the test statistic falls in the rejection region of the null distribution, then we reject the hypothesis  $H_0$ ; otherwise, we fail to reject  $H_0$ .

Statistical tests (18)

| Test                       | Description                                                      | Assumption                          | Test statistic                                                                         | Null distribution |
|----------------------------|------------------------------------------------------------------|-------------------------------------|----------------------------------------------------------------------------------------|-------------------|
| One-sample z-test          | Compare sample mean to a constant; known $\sigma$                | Large sample or Gaussian            | $z = \frac{\bar{x}-c}{\sigma/\sqrt{N}}$                                                | Standard Gaussian |
| Two-sample z-test          | Compare two sample means; known $\sigma(s)$                      | Large samples or Gaussian           | $z = \frac{\bar{x}-\bar{y}-c}{\sqrt{\frac{\sigma_X^2}{N_X} + \frac{\sigma_Y^2}{N_Y}}}$ | Standard Gaussian |
| One-sample t-test          | Compare sample mean to a constant; unknown $\sigma$              | Large sample or Gaussian            | $t = \frac{\bar{x}-c}{s/\sqrt{N}}$                                                     | Student-t         |
| Two-sample t-test          | Compare two sample means; unknown $\sigma(s)$                    | Large samples or Gaussian           | $t = \frac{\bar{x}-\bar{y}-c}{\sqrt{\frac{s_X^2}{N_X} + \frac{s_Y^2}{N_Y}}}$           | Student-t         |
| Paired t-test              | Compare sample mean of differences to a constant                 | Large sample or difference Gaussian | $t = \frac{m_{X-Y}-c}{s_{X-Y}/\sqrt{N}}$                                               | Student-t         |
| Exact Binomial test        | Compare estimated success rate $\frac{k}{N}$ to a constant       | Small sample                        | $k$                                                                                    | Binomial          |
| Approximate Binomial test  |                                                                  | Large sample                        | $z = \frac{k-N\pi}{\sqrt{N\pi(1-\pi)}}$                                                | Standard Gaussian |
| Exact McNemar's test       | Test if an action have different effects on two different groups | Small discordance $n_{01} + n_{10}$ | $n_{01} + n_{10}$                                                                      | Binomial          |
| Approximate McNemar's test |                                                                  | Large discordance $n_{01} + n_{10}$ | $\min(n_{01}, n_{10})$                                                                 | $\mathcal{X}^2$   |

# Machine learning: classification

## Multinomial naive Bayes classifier (15)

- **Prediction  $y$ :** categorical data  $y \in \{1, \dots, C\}$
- **Variables  $x_i, i = 1, \dots, n$ :** categorical data  $x_i \in V$ , where  $V$  is the vocabulary  $V = \{w_1, \dots, w_K\}$  given  $K$  unique categories
  - **Assumptions:**
    - \*  $x_i$ 's are independent - **NAIVE!**
    - \*  $x_i$  follows a categorical distribution

Note: here  $n$  is the size of the input data, e.g. the length of a document

- **Model  $g$ :**

$$\hat{y} = g(x_1, \dots, x_n) = \arg \max_{c \in \{1, \dots, C\}} P(c) \prod_{i=1}^n P(x_i | c)$$

where  $P(c)$  is the prior and  $\prod_{i=1}^n P(x_i | c)$  is the likelihood under the assumptions

- **Hyperparameters  $h$ :** smoothing factor  $\alpha$ , e.g.  $\alpha = 1$
- **Parameters  $\theta$ :**  $P(c)$ ,  $V$  (if not given) and  $P(w_i | c)$  for all  $w_i \in V$
- **Parameter estimation (training):** given the vocabulary  $V = \{w_k\}_{k=1}^K$  and a training data set  $\{(b_1, y_1), \dots, (b_N, y_N)\}$ , where each  $b_j$  contains a list of words. Let  $N_c = \text{count}(y_j = c)$ .
  - Likelihood  $P(w_i | c)$  for each  $w_i$ :

$$P(w_i | c) = \frac{\text{count}(\forall w_i \in b_j \text{ for } y_j = c) + \alpha}{\text{count}(\forall \text{ words} \in \text{class } c) + \alpha K}$$

- Prior  $P(c)$ :

$$P(c) = \frac{N_c}{N}$$

## Gaussian naive Bayes classifier (15)

- **Prediction  $y$ :** categorical data  $y \in \{1, \dots, C\}$
- **Variables  $x_i, i = 1, \dots, d$ :** continuous numerical data  $x_i \in \mathbb{R}$ 
  - **Assumption:**
    - \*  $x_i$ 's are independent - **NAIVE!**
    - \*  $x_i$  follows a Gaussian distribution
- **Model  $g$ :**

$$\begin{aligned} \hat{y} &= g(x_1, \dots, x_d) \\ &= \arg \max_{c \in \{1, \dots, C\}} P(c) \prod_{i=1}^d f_i(x_i | y = c) \end{aligned}$$

where  $P(c)$  is the prior and  $\prod_{i=1}^d f_i(x_i | y = c)$  is the likelihood under the assumptions with  $f_i(x_i | y = c) = \frac{1}{\sqrt{2\pi\sigma_{c,i}^2}} e^{-\frac{(x_i - \mu_{c,i})^2}{2\sigma_{c,i}^2}}$

- **Parameters  $\theta$ :**  $P(c)$ ,  $\mu_{c,i}$ ,  $\sigma_{c,i}$  in  $f_i(x_i | y = c)$  for all  $c$  and  $i$
- **Parameter estimation (training):** given a training data set  $\{(\mathbf{x}_1, y_1), \dots, (\mathbf{x}_N, y_N)\}$ , where each  $\mathbf{x}_j = [x_1^j, \dots, x_d^j]$  is a vector containing all the features for one data point. Let  $N_c = \text{count}(y_j = c)$ .
  - $\mu_{c,i}$ ,  $\sigma_{c,i}$  in the likelihood  $f_i(x_i | y = c)$  for all variable  $i$  and all classes  $c$ :

$$\hat{\mu}_{c,i} = \frac{1}{N_c} \sum_{t=1}^{N_c} x_i^t$$

$$\hat{\sigma}_{c,i} = \sqrt{\frac{1}{N_c - 1} \sum_{t=1}^{N_c} (x_i^t - \hat{\mu}_{c,i})^2}$$

for all  $t \in \text{class } c$

- Prior  $P(c)$ :

$$P(c) = \frac{N_c}{N}$$

# Machine learning: clustering

## K-means (19)

- **Prediction**  $y$ : categorical data  $y \in \{1, \dots, K\}$
- **Variables**  $x$ :  $d$  dimensional feature vector  $x$

- **Model**:

$$y = \arg \min_{k \in \{1, \dots, K\}} \text{dist}(x, \mu_k)$$

where  $\text{dist}(\cdot, \cdot)$  is a distance measure; in this course, we use the Euclidean distance; it is **hard clustering** - one data point is assigned to only one cluster

- **Hyperparameters**:  $K$
- **Parameters**:  $K$  centroids
- **Parameter estimation**: an iterative method to update the centroids until convergence
  - Randomly choose  $K$  centroids  $\mu_k$  for  $k = 1, \dots, K$ , e.g. randomly choose  $K$  data points from  $\mathcal{X}$
  - Repeat the two steps below until convergence, e.g.  $\mu_k$  does not change anymore
    - \* For all  $i = 1, \dots, N$ , assign  $x_i$  to a cluster  $\hat{k}_i$  by computing

$$\hat{k}_i = \arg \min_{k \in \{1, \dots, K\}} \text{dist}(x_i, \mu_k)$$

- \* Let  $\mathcal{X}_k$  be the set of all  $x_i$  assigned to cluster  $k$  and  $N_k$  be the size of  $\mathcal{X}_k$ , compute

$$\mu_k \leftarrow \frac{1}{N_k} \sum_{x_j \in \mathcal{X}_k} x_j$$

## Gaussian Mixture Models (110, 111)

- **Prediction**  $y$ :  $y$  can be a set of continuous numerical data  $K$  posterior probabilities or categorical data  $y \in \{1, \dots, K\}$
- **Variables**  $x$ : a  $d$  dimensional feature vector  $x = [x_1, \dots, x_d]$  with PDF  $f(x) = \sum_{k=1}^K \pi_k f(x | k)$
- **Model**: for  $k = 1, \dots, K$

$$\underbrace{P(k | x)}_{\text{posterior}} = \frac{\underbrace{P(k)}_{\text{prior}} \underbrace{f(x | k)}_{\text{likelihood of } k \text{ given data}}}{\sum_{c=1}^K P(c) f(x | c)}$$

It is **soft clustering** -  $x$  is assigned to **all clusters** with a probability - the posterior  $P(k | x)$ ; **alternatively**,  $y$  can be defined as the cluster index with the highest posterior probability, i.e.

$$y = \arg \max_{k \in \{1, \dots, K\}} P(k | x) = \arg \max_{k \in \{1, \dots, K\}} P(k) f(x | k)$$

- **Hyperparameters**:  $K$
- **Parameters**: the parameters of the mixture distribution  $f(x)$ 
  - The parameters for each Gaussian likelihood  $f(x | k)$
  - The prior  $P(k)$ , typically denoted as  $\pi_k$
- **Parameter estimation**: the Expectation-Maximization algorithm

## Symbols and notations

- Generic mathematical symbol
  - Integral (area under the curve between  $a$  and  $b$ ):  $\int_a^b f(x)dx$
  - Summation:  $\sum_{i=1}^N x_i = x_1 + x_2 + \cdots + x_N$
  - Product:  $\prod_{i=1}^N x_i = x_1 \times x_2 \times \cdots \times x_N$
  - Factorial:  $n! = n \times (n-1) \times \cdots \times 1$
  - Probability of an event:  $P(\text{event})$
  - $[a, b]$ : the range from  $a$  to  $b$ , where  $a$  and  $b$  are numerical values
  - $\{a, b, \cdots\}$ : a set that contains elements  $a, b, \cdots$
  - Mean value:  $\mu$
  - Standard deviation:  $\sigma$
- Symbols specific in this course
  - $N$ : sample size; number of data points in a data set
  - Chonker duck: a duck that is very round and probably overweight
