# Lecture 7: Hypothesis testing part I Statistical Methods for Data Science

#### Yinan Yu

Department of Computer Science and Engineering

November 25, 2021

# Today

- Terminology
  - Experiment and parameter of interest
  - Null hypothesis and alternative hypothesis
  - Test statistic
  - Null distribution  $f(s \mid H_0)$
  - Significance level  $\alpha$ , power and p-value
- Example
- Summary

#### Learning outcome

- Be able to explain the following terminology
  - Null hypothesis  $H_0$  and alternative hypothesis  $H_A$
  - Test statistic s
  - Null distribution  $f(s \mid H_0)$
  - ullet Significance level lpha and power
  - p-value
- Be able to design and interpret the one-sample z-test

Experiment and parameter of interest Null hypothesis and alternative hypothesi Test statistic Null distribution  $f(s \mid H_0)$  Significance level  $\alpha$ , power and  $\rho$ -value

Terminology Example Summary Experiment and parameter of interest Null hypothesis and alternative hypothesis Test statistic Null distribution  $f(s\mid H_0)$  Significance level  $\alpha$ , power and p-value

# Example

If you control the diet of your ducks, they lose  $2.1\ kg$  after one month on average

xperiment and parameter of interest lull hypothesis and alternative hypothesi rest statistic lull distribution  $f(s \mid H_0)$  ignificance level  $\alpha$ , power and p-value

# Example

If you control the diet of your ducks, they lose 2.1 kg after one month on average

 Company A has developed a drug D to help ducks lose weight. They claim that on average the drug works better than diet control

Experiment and parameter of interest Null hypothesis and alternative hypothesis. Test statistic Null distribution  $f(s \mid H_0)$  Significance level  $\alpha$ , power and p-value

## Example

If you control the diet of your ducks, they lose 2.1 kg after one month on average

- Company A has developed a drug D to help ducks lose weight. They claim that on average the drug works better than diet control
- Company B has developed a drug E and they claim that drug E is more effective than drug D on average

Experiment and parameter of interest Null hypothesis and alternative hypothesi Test statistic Null distribution  $f(\mathbf{s} \mid H_{\mathbf{0}})$  Significance level  $\alpha$ , power and p-value

# Example

If you control the diet of your ducks, they lose 2.1 kg after one month on average

- Company A has developed a drug D to help ducks lose weight. They claim that on average the drug works better than diet control
- Company B has developed a drug E and they claim that drug E is more effective than drug D on average

Experiment and parameter of interest Null hypothesis and alternative hypothesi Test statistic Null distribution  $f(\mathbf{s} \mid H_{\mathbf{0}})$  Significance level  $\alpha$ , power and p-value

# Example

If you control the diet of your ducks, they lose 2.1 kg after one month on average

- Company A has developed a drug D to help ducks lose weight. They claim that on average the drug works better than diet control
- Company B has developed a drug E and they claim that drug E is more effective than drug D on average

You need to help your chonker ducks lose weight. Which drug do you buy? Or should you just control their diet?

 If company A tested drug D on 30 ducks and the average weight loss after one month is 2.2 kg, would you buy drug D instead of regular diet control?

Experiment and parameter of interest Null hypothesis and alternative hypothesi Test statistic Null distribution  $f(s \mid H_0)$  Significance level  $\alpha$ , power and  $\rho$ -value

# Example

If you control the diet of your ducks, they lose 2.1 kg after one month on average

- Company A has developed a drug D to help ducks lose weight. They claim that on average the drug works better than diet control
- Company B has developed a drug E and they claim that drug E is more effective than drug D on average

- If company A tested drug D on 30 ducks and the average weight loss after one month is 2.2 kg, would you buy drug D instead of regular diet control?
- What if company A tested drug D on 30 ducks and the average weight loss after one month is 2.3 kg? Would you buy drug D instead of regular diet control in this case?

Experiment and parameter of interest Null hypothesis and alternative hypothesi Test statistic Null distribution  $f(\mathbf{s} \mid H_{\mathbf{0}})$  Significance level  $\alpha$ , power and p-value

# Example

If you control the diet of your ducks, they lose  $2.1\ kg$  after one month on average

- Company A has developed a drug D to help ducks lose weight. They claim that on average the drug works better than diet control
- Company B has developed a drug E and they claim that drug E is more effective than drug D on average

- If company A tested drug D on 30 ducks and the average weight loss after one month is 2.2 kg, would you buy drug D instead of regular diet control?
- What if company A tested drug D on 30 ducks and the average weight loss after one month is 2.3 kg? Would you buy drug D instead of regular diet control in this case?
- What if company A tested drug D on 100 ducks and the average weight loss after one month is 2.3 kg?

Experiment and parameter of interest Null hypothesis and alternative hypothesi Test statistic Null distribution  $f(\mathbf{s} \mid H_{\mathbf{0}})$  Significance level  $\alpha$ , power and p-value

# Example

If you control the diet of your ducks, they lose 2.1 kg after one month on average

- Company A has developed a drug D to help ducks lose weight. They claim that on average the drug works better than diet control
- Company B has developed a drug E and they claim that drug E is more effective than drug D on average

- If company A tested drug D on 30 ducks and the average weight loss after one month is 2.2 kg, would you buy drug D instead of regular diet control?
- What if company A tested drug D on 30 ducks and the average weight loss after one month is 2.3 kg? Would you buy drug D instead of regular diet control in this case?
- What if company A tested drug D on 100 ducks and the average weight loss after one month is 2.3 kg?
- Now company B tested drug E on 30 ducks and the average weight loss after one month is 2.5 kg, while drug D results in 2.3 kg weight loss with the same setup, would you buy drug E instead of drug D?

# Example

If you control the diet of your ducks, they lose 2.1 kg after one month on average

- Company A has developed a drug D to help ducks lose weight. They claim that on average the drug works better than diet control
- Company B has developed a drug E and they claim that drug E is more effective than drug D on average

You need to help your chonker ducks lose weight. Which drug do you buy? Or should you just control their diet?

- If company A tested drug D on 30 ducks and the average weight loss after one month is 2.2 kg, would you buy drug D instead of regular diet control?
- What if company A tested drug D on 30 ducks and the average weight loss after one month is 2.3 kg? Would you buy drug D instead of regular diet control in this case?
- What if company A tested drug D on 100 ducks and the average weight loss after one month is 2.3 kg?
- Now company B tested drug E on 30 ducks and the average weight loss after one month is 2.5 kg, while drug D results in 2.3 kg weight loss with the same setup, would you buy drug E instead of drug D?

How would you make your decision?

Experiment and parameter of interest Null hypothesis and alternative hypothes Test statistic Null distribution  $f(\mathbf{s} \mid H_0)$  Significance level  $\alpha$ , power and p-value

# Hypothesis'

 Hypothesis: a hypothesis is a proposed explanation for a phenomenon (wikipedia)

Experiment and parameter of interest Null hypothesis and alternative hypothesi Test statistic Null distribution  $f(s \mid H_0)$  Significance level  $\alpha$ , power and p-value

# **Hypo**thesis

- **Hypothesis**: a hypothesis is a proposed explanation for a phenomenon (wikipedia)
- Statistical hypothesis: a proposed distribution that explains a set of random variables

Experiment and parameter of interest Null hypothesis and alternative hypothes Test statistic Null distribution  $f(s \mid H_0)$  Significance level  $\alpha$ , power and p-value

# Hypothesis<sup>'</sup>

- Hypothesis: a hypothesis is a proposed explanation for a phenomenon (wikipedia)
- Statistical hypothesis: a proposed distribution that explains a set of random variables
- Hypothesis testing in statistics: we want to decide if it is likely that
  a random variable follows the distribution proposed by the statistical
  hypothesis

Experiment and parameter of interest Null hypothesis and alternative hypothesi Test statistic Null distribution  $f(s \mid H_0)$  Significance level  $\alpha$ , power and p-value

# Hypothesis

- Hypothesis: a hypothesis is a proposed explanation for a phenomenon (wikipedia)
- Statistical hypothesis: a proposed distribution that explains a set of random variables
- Hypothesis testing in statistics: we want to decide if it is likely that a random variable follows the distribution proposed by the statistical hypothesis
  - The test is based on sample statistics, which are computed from data

# Hypothesis

- Hypothesis: a hypothesis is a proposed explanation for a phenomenon (wikipedia)
- Statistical hypothesis: a proposed distribution that explains a set of random variables
- Hypothesis testing in statistics: we want to decide if it is likely that a random variable follows the distribution proposed by the statistical hypothesis
  - The test is based on sample statistics, which are computed from data
  - $\bullet$  Hypothesis + data  $\to$  decision on rejecting/not rejecting the hypothesis

# Hypothesis testing: a list to go through

- A "boring" statement
- Experiment
- Data x, random variable X

- Parameter estimate  $\hat{\theta}$
- Null hypothesis  $H_0$
- Alternative hypothesis H<sub>A</sub>
- Test statistic s
- Null distribution  $f(s \mid H_0)$
- ullet Significance level  $\alpha$
- p-value

Terminology Example Summary Experiment and parameter of interest Null hypothesis and alternative hypothesis Test statistic Null distribution  $f(s \mid H_0)$  Significance level  $\alpha$ , power and p-value

# Experiment and parameter of interest

Experiment and parameter of interest Null hypothesis and alternative hypothesis Test statistic Null distribution  $f(s \mid H_0)$  Significance level  $\alpha$ , power and p-value

#### Experiment design

Before formulating the statistical hypothesis, we need a "boring" statement: a
claim that we would like to test against, e.g. drug D is not more effective than
regular diet on average; drug E works the same as drug D on average

- Before formulating the statistical hypothesis, we need a "boring" statement: a
  claim that we would like to test against, e.g. drug D is not more effective than
  regular diet on average; drug E works the same as drug D on average
- How do we test the "boring" statement?

Experiment and parameter of interest Null hypothesis and alternative hypothesis Test statistic Null distribution  $f(s \mid H_0)$ Significance level  $\alpha$ , power and p-value

- Before formulating the statistical hypothesis, we need a "boring" statement: a
  claim that we would like to test against, e.g. drug D is not more effective than
  regular diet on average; drug E works the same as drug D on average
- How do we test the "boring" statement? We design and run experiments to collect evidence (data)

- Before formulating the statistical hypothesis, we need a "boring" statement: a claim that we would like to test against, e.g. drug D is not more effective than regular diet on average; drug E works the same as drug D on average
- How do we test the "boring" statement? We design and run experiments to collect evidence (data)
- $\bullet$  Example 1: recall if you control the diet of your ducks, they lose 2.1 kg after one month on average
  - A "boring" statement: drug D is not more effective than regular diet on average

- Before formulating the statistical hypothesis, we need a "boring" statement: a claim that we would like to test against, e.g. drug D is not more effective than regular diet on average; drug E works the same as drug D on average
- How do we test the "boring" statement? We design and run experiments to collect evidence (data)
- $\bullet$  Example 1: recall if you control the diet of your ducks, they lose 2.1 kg after one month on average
  - A "boring" statement: drug D is not more effective than regular diet on average
  - Experiment (5 sec):

- Before formulating the statistical hypothesis, we need a "boring" statement: a claim that we would like to test against, e.g. drug D is not more effective than regular diet on average; drug E works the same as drug D on average
- How do we test the "boring" statement? We design and run experiments to collect evidence (data)
- Example 1: recall if you control the diet of your ducks, they lose 2.1 kg after one month on average
  - A "boring" statement: drug D is not more effective than regular diet on average
  - Experiment (5 sec): test drug D on N chonker ducks and record the average weight loss after one month

- Before formulating the statistical hypothesis, we need a "boring" statement: a claim that we would like to test against, e.g. drug D is not more effective than regular diet on average; drug E works the same as drug D on average
- How do we test the "boring" statement? We design and run experiments to collect evidence (data)
- Example 1: recall if you control the diet of your ducks, they lose 2.1 kg after one month on average
  - A "boring" statement: drug D is not more effective than regular diet on average
  - Experiment (5 sec): test drug D on N chonker ducks and record the average weight loss after one month
  - Data and random variable (5 sec):

- Before formulating the statistical hypothesis, we need a "boring" statement: a claim that we would like to test against, e.g. drug D is not more effective than regular diet on average; drug E works the same as drug D on average
- How do we test the "boring" statement? We design and run experiments to collect evidence (data)
- Example 1: recall if you control the diet of your ducks, they lose 2.1 kg after one month on average
  - A "boring" statement: drug D is not more effective than regular diet on average
  - Experiment (5 sec): test drug D on N chonker ducks and record the average weight loss after one month
  - Data and random variable (5 sec): data  $x_i$  weight loss after one month for  $i = 1, \dots, N$ ; random variable  $X_i$  i.i.d.

- Before formulating the statistical hypothesis, we need a "boring" statement: a claim that we would like to test against, e.g. drug D is not more effective than regular diet on average; drug E works the same as drug D on average
- How do we test the "boring" statement? We design and run experiments to collect evidence (data)
- Example 1: recall if you control the diet of your ducks, they lose 2.1 kg after one month on average
  - A "boring" statement: drug D is not more effective than regular diet on average
  - Experiment (5 sec): test drug D on N chonker ducks and record the average weight loss after one month
  - Data and random variable (5 sec): data  $x_i$  weight loss after one month for  $i = 1, \dots, N$ ; random variable  $X_i$  i.i.d.
  - Parameter of interest (5 sec):

- Before formulating the statistical hypothesis, we need a "boring" statement: a claim that we would like to test against, e.g. drug D is not more effective than regular diet on average; drug E works the same as drug D on average
- How do we test the "boring" statement? We design and run experiments to collect evidence (data)
- Example 1: recall if you control the diet of your ducks, they lose 2.1 kg after one month on average
  - A "boring" statement: drug D is not more effective than regular diet on average
  - Experiment (5 sec): test drug D on N chonker ducks and record the average weight loss after one month
  - Data and random variable (5 sec): data  $x_i$  weight loss after one month for  $i = 1, \dots, N$ ; random variable  $X_i$  i.i.d.
  - Parameter of interest (5 sec): the average weight loss  $\mu_D$

- Before formulating the statistical hypothesis, we need a "boring" statement: a claim that we would like to test against, e.g. drug D is not more effective than regular diet on average; drug E works the same as drug D on average
- How do we test the "boring" statement? We design and run experiments to collect evidence (data)
- Example 1: recall if you control the diet of your ducks, they lose 2.1 kg after one month on average
  - A "boring" statement: drug D is not more effective than regular diet on average
  - Experiment (5 sec): test drug D on N chonker ducks and record the average weight loss after one month
  - Data and random variable (5 sec): data  $x_i$  weight loss after one month for  $i = 1, \dots, N$ ; random variable  $X_i$  i.i.d.
  - Parameter of interest (5 sec): the average weight loss  $\mu_D$
  - Parameter estimate (5 sec):

- Before formulating the statistical hypothesis, we need a "boring" statement: a claim that we would like to test against, e.g. drug D is not more effective than regular diet on average; drug E works the same as drug D on average
- How do we test the "boring" statement? We design and run experiments to collect evidence (data)
- Example 1: recall if you control the diet of your ducks, they lose 2.1 kg after one month on average
  - A "boring" statement: drug D is not more effective than regular diet on average
  - Experiment (5 sec): test drug D on N chonker ducks and record the average weight loss after one month
  - Data and random variable (5 sec): data  $x_i$  weight loss after one month for  $i = 1, \dots, N$ ; random variable  $X_i$  i.i.d.
  - Parameter of interest (5 sec): the average weight loss  $\mu_D$
  - Parameter estimate (5 sec):  $\hat{\mu_D} = \bar{x} = \frac{1}{N} \sum_{i=1}^{N} x_i$

- Before formulating the statistical hypothesis, we need a "boring" statement: a claim that we would like to test against, e.g. drug D is not more effective than regular diet on average; drug E works the same as drug D on average
- How do we test the "boring" statement? We design and run experiments to collect evidence (data)
- Example 1: recall if you control the diet of your ducks, they lose 2.1 kg after one month on average
  - A "boring" statement: drug D is not more effective than regular diet on average
  - Experiment (5 sec): test drug D on N chonker ducks and record the average weight loss after one month
  - **Data** and **random variable** (5 sec): data  $x_i$  weight loss after one month for  $i = 1, \dots, N$ ; random variable  $X_i$  i.i.d.
  - Parameter of interest (5 sec): the average weight loss  $\mu_D$
  - Parameter estimate (5 sec):  $\hat{\mu_D} = \bar{x} = \frac{1}{N} \sum_{i=1}^{N} x_i$

Then we can use  $\bar{x}$  to approximate  $\mu_D$  and check if it is greater than diet control (2.1 kg)

  - Parameter of interest (5 secs): the average weight loss  $\mu_D$  and  $\mu_E$  for drug D and E, respectively
  - Parameter estimate (5 secs):  $\hat{\mu}_D = \bar{x} = \frac{1}{N_D} \sum_{i=1}^{N_D} x_i$  and  $\hat{\mu}_E = \bar{y} = \frac{1}{N_C} \sum_{i=1}^{N_E} y_i$

Then we use  $\bar{x}$  and  $\bar{y}$  to approximate  $\mu_D$  and  $\mu_E$  to see if they are the same

Experiment and parameter of interest Null hypothesis and alternative hypothesis Test statistic Null distribution  $f(s \mid H_0)$  Significance level  $\alpha$ , power and p-value

#### Experiment design (cont.)

 We make our decision by observing data; if the evidence does not support the "boring" statement, we reject the statement; otherwise, we do not reject the statement

Experiment and parameter of interest Null hypothesis and alternative hypothesis. Test statistic Null distribution  $f(s \mid H_0)$  Significance level  $\alpha$ , power and p-value

- We make our decision by observing data; if the evidence does not support the "boring" statement, we reject the statement; otherwise, we do not reject the statement
- But we can never prove or accept the statement we can only reject
  a statement by showing counterexamples

- We make our decision by observing data; if the evidence does not support the "boring" statement, we reject the statement; otherwise, we do not reject the statement
- But we can never prove or accept the statement we can only reject
  a statement by showing counterexamples
- The logic here is: if a statement is true, then the evidence should support the statement

- We make our decision by observing data; if the evidence does not support the "boring" statement, we reject the statement; otherwise, we do not reject the statement
- But we can never prove or accept the statement we can only reject
  a statement by showing counterexamples
- The logic here is: if a statement is true, then the evidence should support the statement if the evidence does not support the statement, the statement is considered false

- We make our decision by observing data; if the evidence does not support the "boring" statement, we reject the statement; otherwise, we do not reject the statement
- But we can never prove or accept the statement we can only reject
  a statement by showing counterexamples
- The logic here is: if a statement is true, then the evidence should support the statement ←⇒ if the evidence does not support the statement, the statement is considered false ←⇒ if the evidence supports the statement, the statement must be true

Terminology Example Summary Experiment and parameter of interest Null hypothesis and alternative hypothesis Test statistic Null distribution  $f(s \mid H_0)$  Significance level  $\alpha$ , power and p-value

# Null hypothesis and alternative hypothesis

Experiment and parameter of interest Null hypothesis and alternative hypothesis Test statistic Null distribution  $f(s \mid H_0)$  Significance level  $\alpha$ , power and p-value

# Hypotheses $H_0$ and $H_A$

Statistical hypothesis: a proposed distribution

Experiment and parameter of interest Null hypothesis and alternative hypothesis Test statistic Null distribution  $f(s \mid H_0)$  Significance level  $\alpha$ , power and p-value

# Hypotheses $H_0$ and $H_A$

 Statistical hypothesis: a proposed distribution - a statement about the parameter of interest

# Hypotheses $\overline{H_0}$ and $\overline{H_A}$

- Statistical hypothesis: a proposed distribution a statement about the parameter of interest
- $\bullet$  Null hypothesis  $H_0$ : the "boring" statement translated into a mathematical expression

- Statistical hypothesis: a proposed distribution a statement about the parameter of interest
- $\bullet$  Null hypothesis  $H_0$ : the "boring" statement translated into a mathematical expression
  - Example 1: drug D is not more effective than regular diet on average

$$H_0: \mu_D = 2.1$$

- Statistical hypothesis: a proposed distribution a statement about the parameter of interest
- Null hypothesis H<sub>0</sub>: the "boring" statement translated into a mathematical expression
  - Example 1: drug D is not more effective than regular diet on average

$$H_0: \mu_D = 2.1$$

Example 2: drug E and drug D work the same on average (5 sec)

Experiment and parameter of interest Null hypothesis and alternative hypothesis Test statistic Null distribution  $f(s \mid H_0)$  Significance level  $\alpha$ , power and p-value

# Hypotheses $H_0$ and $H_A$

- Statistical hypothesis: a proposed distribution a statement about the parameter of interest
- Null hypothesis H<sub>0</sub>: the "boring" statement translated into a mathematical expression
  - Example 1: drug D is not more effective than regular diet on average

$$H_0: \mu_D = 2.1$$

Example 2: drug E and drug D work the same on average (5 sec)

$$H_0: \mu_D = \mu_E$$

- Statistical hypothesis: a proposed distribution a statement about the parameter of interest
- Null hypothesis H<sub>0</sub>: the "boring" statement translated into a mathematical expression
  - Example 1: drug D is not more effective than regular diet on average

$$H_0: \mu_D = 2.1$$

Example 2: drug E and drug D work the same on average (5 sec)

$$H_0: \mu_D = \mu_E$$

 Alternative hypothesis H<sub>A</sub>: a complementary alternative explanation to the "boring" statement

- Statistical hypothesis: a proposed distribution a statement about the parameter of interest
- Null hypothesis H<sub>0</sub>: the "boring" statement translated into a mathematical expression
  - Example 1: drug D is not more effective than regular diet on average

$$H_0: \mu_D = 2.1$$

Example 2: drug E and drug D work the same on average (5 sec)

$$H_0: \mu_D = \mu_E$$

- Alternative hypothesis H<sub>A</sub>: a complementary alternative explanation to the "boring" statement
  - Example 1: drug D is more effective than regular diet on average (5 sec)

- Statistical hypothesis: a proposed distribution a statement about the parameter of interest
- Null hypothesis H<sub>0</sub>: the "boring" statement translated into a mathematical expression
  - Example 1: drug D is not more effective than regular diet on average

$$H_0: \mu_D = 2.1$$

Example 2: drug E and drug D work the same on average (5 sec)

$$H_0: \mu_D = \mu_E$$

- Alternative hypothesis H<sub>A</sub>: a complementary alternative explanation to the "boring" statement
  - Example 1: drug D is more effective than regular diet on average (5 sec)

$$H_A: \mu_D > 2.1$$

- Statistical hypothesis: a proposed distribution a statement about the parameter of interest
- $\bullet$  Null hypothesis  $H_0$ : the "boring" statement translated into a mathematical expression
  - Example 1: drug D is not more effective than regular diet on average

$$H_0: \mu_D = 2.1$$

Example 2: drug E and drug D work the same on average (5 sec)

$$H_0: \mu_D = \mu_E$$

- Alternative hypothesis H<sub>A</sub>: a complementary alternative explanation to the "boring" statement
  - Example 1: drug D is more effective than regular diet on average (5 sec)

$$H_A : \mu_D > 2.1$$

• Example 2: drug E and drug D do not work the same on average (5 sec)

- Statistical hypothesis: a proposed distribution a statement about the parameter of interest
- Null hypothesis H<sub>0</sub>: the "boring" statement translated into a mathematical expression
  - Example 1: drug D is not more effective than regular diet on average

$$H_0: \mu_D = 2.1$$

Example 2: drug E and drug D work the same on average (5 sec)

$$H_0: \mu_D = \mu_E$$

- Alternative hypothesis H<sub>A</sub>: a complementary alternative explanation to the "boring" statement

#### Questions:

• Question 1: why are  $H_A$ :  $\mu_D > 2.1$  and  $H_0$ :  $\mu_D = 2.1$  complementary to each other? What about  $H_A$ :  $\mu_D < 2.1$ ?

#### Questions:

• Question 1: why are  $H_A$ :  $\mu_D > 2.1$  and  $H_0$ :  $\mu_D = 2.1$  complementary to each other? What about  $H_A$ :  $\mu_D < 2.1$ ?

Answer: an implicit assumption here is that  $\mu_D$  will not be smaller than 2.1

#### Questions:

- Question 1: why are  $H_A$ :  $\mu_D>2.1$  and  $H_0$ :  $\mu_D=2.1$  complementary to each other? What about  $H_A$ :  $\mu_D<2.1$ ?
- Answer: an implicit assumption here is that  $\mu_D$  will not be smaller than 2.1
- Question 2: can  $H_0$  and  $H_A$  be ANYTHING I want? Like a magic mirror!?

#### Questions:

- Question 1: why are  $H_A$ :  $\mu_D > 2.1$  and  $H_0$ :  $\mu_D = 2.1$  complementary to each other? What about  $H_A$ :  $\mu_D < 2.1$ ?
  - Answer: an implicit assumption here is that  $\mu_D$  will not be smaller than 2.1
- Question 2: can  $H_0$  and  $H_A$  be ANYTHING I want? Like a magic mirror!? Answer: no

#### Questions:

- Question 1: why are  $H_A$ :  $\mu_D > 2.1$  and  $H_0$ :  $\mu_D = 2.1$  complementary to each other? What about  $H_A$ :  $\mu_D < 2.1$ ?
- Answer: an implicit assumption here is that  $\mu_D$  will not be smaller than 2.1
- Question 2: can  $H_0$  and  $H_A$  be ANYTHING I want? Like a magic mirror!? Answer: no
- Follow up question: what are the choices for  $H_0$  and  $H_A$ ?

Experiment and parameter of interest Null hypothesis and alternative hypothesis Test statistic Null distribution  $f(s \mid H_0)$  Significance level  $\alpha$ , power and p-value

#### Choices for $H_0$

• In this course, we only deal with null hypotheses with an equal sign in them only one fixed choice for the distribution proposed by  $H_0$ 

Experiment and parameter of interest Null hypothesis and alternative hypothesis Test statistic Null distribution  $f(s \mid H_0)$  Significance level  $\alpha$ , power and p-value

#### Choices for $H_0$

- In this course, we only deal with null hypotheses with an equal sign in them only one fixed choice for the distribution proposed by  $H_0$
- Null hypothesis  $H_0$ : two cases

- In this course, we only deal with null hypotheses with an equal sign in them only one fixed choice for the distribution proposed by  $H_0$
- Null hypothesis H<sub>0</sub>: two cases
  - One-sample test: to test a data distribution against a theoretical probability distribution, i.e. for a given constant c

$$H_0: \theta = c$$

For example, is a binary classifier more accurate than random?

- In this course, we only deal with null hypotheses with an equal sign in them only one fixed choice for the distribution proposed by  $H_0$
- Null hypothesis H<sub>0</sub>: two cases
  - One-sample test: to test a data distribution against a theoretical probability distribution, i.e. for a given constant c

$$H_0: \theta = c$$

For example, is a binary classifier more accurate than random?  $H_0: p = 50\%$ 

- In this course, we only deal with null hypotheses with an equal sign in them only one fixed choice for the distribution proposed by  $H_0$
- Null hypothesis H<sub>0</sub>: two cases
  - One-sample test: to test a data distribution against a theoretical probability distribution, i.e. for a given constant c

$$H_0: \theta = c$$

For example, is a binary classifier more accurate than random?  $H_0: p = 50\%$ 

 Two-sample test: to test a data distribution against another data distribution, i.e.

$$H_0: \theta_1 = \theta_2$$

For example, is classifier A better than classifier B?

- In this course, we only deal with null hypotheses with an equal sign in them only one fixed choice for the distribution proposed by  $H_0$
- Null hypothesis H<sub>0</sub>: two cases
  - One-sample test: to test a data distribution against a theoretical probability distribution, i.e. for a given constant c

$$H_0: \theta = c$$

For example, is a binary classifier more accurate than random?  $H_0: p = 50\%$ 

 Two-sample test: to test a data distribution against another data distribution, i.e.

$$H_0: \theta_1 = \theta_2$$

For example, is classifier A better than classifier B?  $H_0: p_A = p_B$ 

- In this course, we only deal with null hypotheses with an equal sign in them only one fixed choice for the distribution proposed by  $H_0$
- Null hypothesis  $H_0$ : two cases
  - One-sample test: to test a data distribution against a theoretical probability distribution, i.e. for a given constant c

$$H_0: \theta = c$$

For example, is a binary classifier more accurate than random?  $H_0: p = 50\%$ 

 Two-sample test: to test a data distribution against another data distribution, i.e.

$$H_0: \theta_1 = \theta_2$$

For example, is classifier A better than classifier B?  $H_0: p_A = p_B$ 

- We have seen one-sample test and two-sample test in the Q-Q plot lecture
- In practice, you can narrow down your choice of hypotheses by making a Q-Q plot

## Choices for $H_A$

#### Given

$$H_0: \theta = \beta$$

where  $\beta$  can be either a constant (one-sample test) or a parameter from another data distribution (two-sample test)

- Alternative hypothesis  $H_A$ :  $H_A$  can be one-tailed or two-tailed
  - One-tailed:

$$H_A: \theta > \beta$$

or

$$H_A: \theta < \beta$$

Two-tailed:

$$H_A: \theta \neq \beta \iff \theta < \beta \text{ or } \theta > \beta$$

# Summary: choices for $H_0$ and $H_A$

Putting everything together,

	One-sample test	Two-sample test
Two-tailed	$H_0: \theta = c, H_A: \theta \neq c$	$H_0: \theta_1 = \theta_2, H_A: \theta_1 \neq \theta_2$
One-tailed	$H_0: \theta = c, H_A: \theta > c$	$H_0: \theta_1 = \theta_2, H_A: \theta_1 > \theta_2$
	$H_0: \theta = c, H_A: \theta < c$	$H_0: \theta_1 = \theta_2, H_A: \theta_1 < \theta_2$

where  $\theta$ ,  $\theta_1$ ,  $\theta_2$  are the parameters of interest and c is a constant

Terminology Example Summary Experiment and parameter of interest Null hypothesis and alternative hypothesi Test statistic Null distribution  $f(s \mid H_0)$  Significance level  $\alpha$ , power and p-value

Null distribution  $f(s \mid H_0)$ Significance level  $\alpha$ , power and p-value

### Test statistic

• Test statistic s, random variable S: the statistic used for testing the hypothesis

Experiment and parameter of interest Null hypothesis and alternative hypothesis **Test statistic**Null distribution  $f(s \mid H_0)$ Significance level  $\alpha$ , power and p-value

- Test statistic s, random variable S: the statistic used for testing the hypothesis
  - s is the observation

Experiment and parameter of interest Null hypothesis and alternative hypothesi **Test statistic**Null distribution  $f(s \mid H_0)$ Significance level  $\alpha$ , power and p-value

- Test statistic s, random variable S: the statistic used for testing the hypothesis
  - s is the observation
  - Given a set of parameters of interest and a set of estimates, s is typically a standardized statistic computed from the estimates

Experiment and parameter of interest Null hypothesis and alternative hypothesis Test statistic Null distribution  $f(s \mid H_0)$  Significance level  $\alpha$ , power and p-value

- Test statistic s, random variable S: the statistic used for testing the hypothesis
  - s is the observation
  - Given a set of parameters of interest and a set of estimates, s is typically a standardized statistic computed from the estimates
  - Purpose: to compare s with a standard distribution, e.g. the standard Gaussian distribution  $\mathcal{N}(0,1)$ , to see if it is likely that the standard distribution is the underlying distribution of S, i.e. if the null hypothesis is plausible

- Test statistic s, random variable S: the statistic used for testing the hypothesis
  - s is the observation
  - Given a set of parameters of interest and a set of estimates, s is typically a standardized statistic computed from the estimates
  - Purpose: to compare s with a standard distribution, e.g. the standard Gaussian distribution  $\mathcal{N}(0,1)$ , to see if it is likely that the standard distribution is the underlying distribution of S, i.e. if the null hypothesis is plausible
- What is needed for computing the test statistic?
  - Assumptions on random variables  $X_i$
  - We only need the null hypothesis  $H_0$  (not  $H_A$ ) to choose the test statistic

### Test statistic

- Test statistic s, random variable S: the statistic used for testing the hypothesis
  - s is the observation
  - Given a set of parameters of interest and a set of estimates, s is typically a standardized statistic computed from the estimates
  - Purpose: to compare s with a standard distribution, e.g. the standard Gaussian distribution  $\mathcal{N}(0,1)$ , to see if it is likely that the standard distribution is the underlying distribution of S, i.e. if the null hypothesis is plausible
- What is needed for computing the test statistic?
  - Assumptions on random variables  $X_i$
  - We only need the null hypothesis  $H_0$  (not  $H_A$ ) to choose the test statistic

Note: in this course, we only deal with null hypothesis where we are able to express the PDF/PMF  $f(s \mid H_0)$ , i.e.  $H_0$  with an equal sign in them

  - Assuming the null hypothesis: data are assumed to be generated from the distribution described by the null hypothesis  $X_i \sim \mathcal{N}(\mu_D, \sigma^2)$

Standardize  $\bar{x}$  (15 sec)

$$z = \frac{\bar{x} - 2.1}{\sigma / \sqrt{N}}$$

## Test statistic (cont.)

#### Example 2. two-sample test

- Data:  $x_1, \dots, x_{N_D}$  and  $y_1, \dots, y_{N_E}$
- Random variable:  $X_1, \dots, X_{N_D}$  i.i.d. Gaussian with known  $\sigma_D$ ;  $Y_1, \dots, Y_{N_E}$  i.i.d. Gaussian with known  $\sigma_E$ ;  $X_i$  and  $Y_j$  independent
- Parameter of interest:  $\mu_D$ ,  $\mu_E$
- Parameter estimate:  $\bar{x}$ ,  $\bar{y}$
- Null hypothesis:  $H_0: \mu_D = \mu_E \iff H_0: \mu_D \mu_E = 0$
- Test statistic: standardized  $\bar{x} \bar{y}$  assuming the null hypothesis

$$z = \frac{\bar{x} - \bar{y}}{\sqrt{\sigma_D^2/N_D + \sigma_E^2/N_E}} \text{ (explained later)}$$

Terminology Example Summary Experiment and parameter of interest Null hypothesis and alternative hypothesis Test statistic

Null distribution  $f(s \mid H_0)$ Significance level  $\alpha$ , power and p-value

# Null distribution $f(s \mid H_0)$

### Null distribution

- Null distribution  $f(s \mid H_0)$ : the distribution of the test statistic given the null hypothesis
- Example:
  - Data:  $x_1, \dots, x_N$
  - Random variable:  $X_1, \dots, X_N$  i.i.d. Gaussian with known  $\sigma$
  - Parameter of interest:  $\mu$
  - Parameter estimate:  $\bar{x}$
  - Null hypothesis:  $H_0: \mu = \mu_0$
  - Test statistic:

$$z = \frac{\bar{x} - \mu_0}{\sigma / \sqrt{N}}$$

• Null distribution: standard Gaussian distribution

Terminology Example Summary Experiment and parameter of interest Null hypothesis and alternative hypothesi Test statistic Null distribution  $f(s \mid H_0)$  Significance level  $\alpha$ , power and p-value

# Significance level $\alpha$ , power and p-value

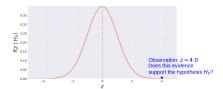

# Significance level

Given a null hypothesis  $H_0: \mu=2.1$  and the null distribution  $f(s\mid H_0)$ , we decide if we reject the hypothesis or not by observing data

- Run some experiments and collect data  $x_1, \dots, x_N$
- Estimate the parameter of interest  $\hat{\theta}$ , e.g.  $\hat{\mu} = \bar{x} = \frac{1}{N} \sum_{i=1}^{N} x_i$
- ullet Standardize  $\hat{ heta}$  assuming  $H_0$  to compute the test statistic, e.g.

$$z = \frac{\bar{x} - 2.1}{\sigma / \sqrt{N}} = 4.0$$

• Does this evidence support the hypothesis  $H_0$ ?

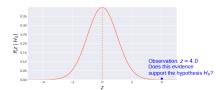

## Significance level

Given a null hypothesis  $H_0: \mu=2.1$  and the null distribution  $f(s\mid H_0)$ , we decide if we reject the hypothesis or not by observing data

- ullet Run some experiments and collect data  $x_1, \cdots, x_N$
- Estimate the parameter of interest  $\hat{\theta}$ , e.g.  $\hat{\mu} = \bar{x} = \frac{1}{N} \sum_{i=1}^{N} x_i$
- ullet Standardize  $\hat{ heta}$  assuming  $H_0$  to compute the test statistic, e.g.

$$z = \frac{\bar{x} - 2.1}{\sigma / \sqrt{N}} = 4.0$$

• Does this evidence support the hypothesis  $H_0$ ? Probably not since it's so far away from the center?

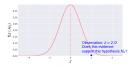

Experiment and parameter of interest Null hypothesis and alternative hypothesis: Test statistic
Null distribution  $f(s \mid H_0)$ Significance level  $\alpha$ , power and p-value

# Significance level (cont.)

• What about this observation?

• What about this observation?

• To be able to answer the question, you need to decide where you draw the line

Experiment and parameter of interest Null hypothesis and alternative hypothesi Test statistic Null distribution  $f(s \mid H_0)$  Significance level  $\alpha$ , power and p-value

# Significance level (cont.)

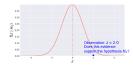

• What about this observation?

 To be able to answer the question, you need to decide where you draw the line - define a rejection region by choosing a significance level

• What about this observation?

- To be able to answer the question, you need to decide where you draw the line define a rejection region by choosing a significance level
- Significance level  $\alpha$ : red area under the curve

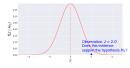

In these three images,  $\alpha = 0.05$ 

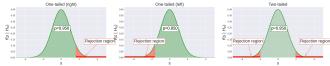

• What about this observation?

- To be able to answer the question, you need to decide where you draw the line define a rejection region by choosing a significance level
- Significance level  $\alpha$ : red area under the curve

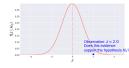

In these three images,  $\alpha = 0.05$ 

More conservative  $\Rightarrow$  less probable to reject  $H_0$ , which indicates a smaller rejection region

• What about this observation?

- To be able to answer the question, you need to decide where you draw the line define a rejection region by choosing a significance level
- Significance level  $\alpha$ : red area under the curve

In these three images,  $\alpha = 0.05$ 

More conservative  $\Rightarrow$  less probable to reject  $H_0$ , which indicates a smaller rejection region Two-tailed  $H_A$  is more conservative

Experiment and parameter of interest Null hypothesis and alternative hypothesi Test statistic Null distribution  $f(s \mid H_0)$  Significance level  $\alpha$ , power and p-value

# Significance level (cont.)

What is needed for choosing a meaningful  $\alpha$ ?

- Null distribution
- H<sub>A</sub> one-tailed or two-tailed

# Interpretation of lpha

•  $\alpha = P(reject \ H_0 \mid H_0 \ is \ true)$  - the probability of making such a mistake

- The rejection region indicates that  $H_0$  is **unlikely**, but the probability is not zero
- It is possible that  $H_0$  is true, but our observation happens to fall in the rejection region
- If  $H_0$  is true and our observation falls in the rejection region, we will **mistakenly** reject  $H_0$
- ullet The probability of making this type of mistakes is lpha
- ullet Similar to the confidence interval, 1-lpha is called the **confidence level**

# Interpretation of lpha

•  $\alpha = P(reject \ H_0 \mid H_0 \ is \ true)$  - the probability of making such a mistake

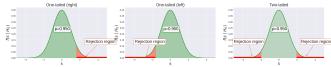

- The rejection region indicates that  $H_0$  is **unlikely**, but the probability is not zero
- It is possible that  $H_0$  is true, but our observation happens to fall in the rejection region
- If H<sub>0</sub> is true and our observation falls in the rejection region, we will mistakenly reject H<sub>0</sub>
- ullet The probability of making this type of mistakes is lpha
- Similar to the confidence interval,  $1-\alpha$  is called the confidence level "with 95% confidence, rejecting  $H_0$  is the right thing to do"

### Interpretation of $\alpha$

•  $\alpha = P(reject \ H_0 \mid H_0 \ is \ true)$  - the probability of making such a mistake

- The rejection region indicates that  $H_0$  is **unlikely**, but the probability is not zero
- It is possible that  $H_0$  is true, but our observation happens to fall in the rejection region
- If  $H_0$  is true and our observation falls in the rejection region, we will **mistakenly** reject  $H_0$
- ullet The probability of making this type of mistakes is lpha
- Similar to the confidence interval,  $1-\alpha$  is called the confidence level "with 95% confidence, rejecting  $H_0$  is the right thing to do"
- Define the significance level before you run the experiments so that you can't cheat!

## Significance level and power

• Contingency table:

	$y = H_A$	$y = H_0$
$\hat{y} = \text{reject } H_0$	TP	FP (Type I error)
$\hat{y} = \text{do not reject } H_0$	FN (Type II error)	TN

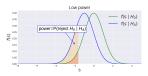

• Significance level  $\alpha$ : incorrectly rejecting  $H_0$ 

$$\alpha = P(\mathsf{type}\;\mathsf{I}\;\mathsf{error})$$

• Power: correctly rejecting  $H_0$ 

power = 
$$P(\text{reject } H_0 \mid H_A) = 1 - P(\text{type II error})$$

• What is needed for computing the power?

## Significance level and power

Contingency table:

	$y = H_A$	$y = H_0$
$\hat{y} = \text{reject } H_0$	TP	FP (Type I error)
$\hat{y} = \text{do not reject } H_0$	FN (Type II error)	TN

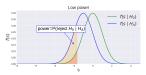

• Significance level  $\alpha$ : incorrectly rejecting  $H_0$ 

$$\alpha = P(\mathsf{type}\;\mathsf{I}\;\mathsf{error})$$

• Power: correctly rejecting  $H_0$ 

power = 
$$P(\text{reject } H_0 \mid H_A) = 1 - P(\text{type II error})$$

• What is needed for computing the power?  $f(s \mid H_0)$ ,  $f(s \mid H_A)$ 

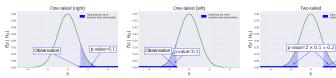

### *p*-value

- p-value:
  - One-tailed:
    - Right tail:  $p = P(S > s \mid H_0)$
    - Left tail:  $p = P(S \le s \mid H_0)$
  - Two-tailed:  $p = 2 \min (P(S \le s \mid H_0), P(S \ge s \mid H_0))$ Note: for example, if  $f(s \mid H_0)$  is symmetric around zero and s < 0,

$$p = 2P(S \le s \mid H_0)$$

• What is needed for computing the p-value? (10 sec)

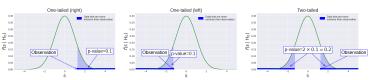

Observation

Experiment and parameter of interest Null hypothesis and alternative hypothesi Test statistic
Null distribution  $f(s \mid H_0)$ Significance level  $\alpha$ , power and p-value

### *p*-value

- p-value:
  - One-tailed:
    - Right tail:  $p = P(S > s \mid H_0)$
    - Left tail:  $p = P(S \le s \mid H_0)$
  - Two-tailed:  $p = 2 \min (P(S \le s \mid H_0), P(S \ge s \mid H_0))$ Note: for example, if  $f(s \mid H_0)$  is symmetric around zero and s < 0,

$$p = 2P(S \le s \mid H_0)$$

- What is needed for computing the p-value? (10 sec)
  - Null distribution
  - $\bullet$  Alternative hypothesis  $H_A$  to know one-tailed or two-tailed
  - Observation test statistic computed from data

Experiment and parameter of interest Null hypothesis and alternative hypothes Test statistic Null distribution  $f(s \mid H_0)$  Significance level  $\alpha$ , power and p-value

## Summary: steps for hypothesis testing

- Step 1 Make a "boring" statement
- Step 2 Design an experiment
- Step 3 Describe the data generated from the experiment and the corresponding random variables
- Step 4 Describe the parameter of interest and their estimates
- Step 5 Translate the "boring" statement into a statistical hypothesis and call it the null hypothesis  $H_0$
- Step 6 Find the expression for the **test statistic** *s*
- Step 7 Find the expression for the null distribution
- Step 8 Define an alternative hypothesis  $H_A$ : one-tailed or two-tailed
- Step 9 Choose a significance level  $\alpha$  (the tail), which defines the rejection region
- Step 10 Collect data
- Step 11 Compute the test statistic from data
- Step 12 Compute the p-value
- Step 13 If p-value<  $\alpha$ , i.e. the test statistic falls in the rejection region of the null distribution, then we reject the hypothesis  $H_0$ ; otherwise, we fail to reject  $H_0$ .

Recall example: if you control the diet of your ducks, they lose 2.1 kg after one month on average. Company A has developed a drug D to help ducks lose weight. They claim that on average the drug works better than diet control. Here is the set up for the experiment.

Step 1 Make a "boring" statement (5 secs):

Recall example: if you control the diet of your ducks, they lose 2.1 kg after one month on average. Company A has developed a drug D to help ducks lose weight. They claim that on average the drug works better than diet control. Here is the set up for the experiment.

Step 1 Make a "boring" statement (5 secs): drug D works the same as diet

- Step 1 Make a "boring" statement (5 secs): drug D works the same as diet
- Step 2 Design an experiment (choose N = 30) (10 secs):

- Step 1 Make a "boring" statement (5 secs): drug D works the same as diet
- Step 2 Design an experiment (choose N=30) (10 secs): let 30 chonker ducks take drug D and measure their weight loss after one month

- Step 1 Make a "boring" statement (5 secs): drug D works the same as diet
- Step 2 Design an experiment (choose N = 30) (10 secs): let 30 chonker ducks take drug D and measure their weight loss after one month
- Step 3 Describe the data and random variables with assumptions about their distributions (5 secs):

- Step 1 Make a "boring" statement (5 secs): drug D works the same as diet
- Step 2 Design an experiment (choose N = 30) (10 secs): let 30 chonker ducks take drug D and measure their weight loss after one month
- Step 3 Describe the data and random variables with assumptions about their distributions (5 secs): weight loss  $x_1, \cdots, x_{30}; \ X_1, \cdots, X_{30}$  i.i.d. Gaussian random variables

- Step 1 Make a "boring" statement (5 secs): drug D works the same as diet
- Step 2 Design an experiment (choose N = 30) (10 secs): let 30 chonker ducks take drug D and measure their weight loss after one month
- Step 3 Describe the data and random variables with assumptions about their distributions (5 secs): weight loss  $x_1, \cdots, x_{30}$ ;  $X_1, \cdots, X_{30}$  i.i.d. Gaussian random variables let's make an additional assumption to simplify the problem the standard deviation of  $X_i$   $\sigma=0.6$  is known

- Step 1 Make a "boring" statement (5 secs): drug D works the same as diet
- Step 2 Design an experiment (choose N = 30) (10 secs): let 30 chonker ducks take drug D and measure their weight loss after one month
- Step 3 Describe the data and random variables with assumptions about their distributions (5 secs): weight loss  $x_1, \cdots, x_{30}$ ;  $X_1, \cdots, X_{30}$  i.i.d. Gaussian random variables let's make an additional assumption to simplify the problem the standard deviation of  $X_i$   $\sigma=0.6$  is known
- Step 4 Describe the parameter of interest and their estimates (10 secs):

- Step 1 Make a "boring" statement (5 secs): drug D works the same as diet
- Step 2 Design an experiment (choose N = 30) (10 secs): let 30 chonker ducks take drug D and measure their weight loss after one month
- Step 3 Describe the data and random variables with assumptions about their distributions (5 secs): weight loss  $x_1, \cdots, x_{30}$ ;  $X_1, \cdots, X_{30}$  i.i.d. Gaussian random variables let's make an additional assumption to simplify the problem the standard deviation of  $X_i$   $\sigma=0.6$  is known
- Step 4 Describe the parameter of interest and their estimates (10 secs): the mean value  $\mu_D$  and  $\hat{\mu}_D = \bar{x}$

- Step 1 Make a "boring" statement (5 secs): drug D works the same as diet
- Step 2 Design an experiment (choose N = 30) (10 secs): let 30 chonker ducks take drug D and measure their weight loss after one month
- Step 3 Describe the data and random variables with assumptions about their distributions (5 secs): weight loss  $x_1, \cdots, x_{30}$ ;  $X_1, \cdots, X_{30}$  i.i.d. Gaussian random variables let's make an additional assumption to simplify the problem the standard deviation of  $X_i$   $\sigma = 0.6$  is known
- Step 4 Describe the parameter of interest and their estimates (10 secs): the mean value  $\mu_D$  and  $\hat{\mu}_D = \bar{x}$
- Step 5 Translate the "boring" statement into a statistical hypothesis and call it the **null hypothesis**  $H_0$  (10 secs):

- Step 1 Make a "boring" statement (5 secs): drug D works the same as diet
- Step 2 Design an experiment (choose N = 30) (10 secs): let 30 chonker ducks take drug D and measure their weight loss after one month
- Step 3 Describe the data and random variables with assumptions about their distributions (5 secs): weight loss  $x_1, \cdots, x_{30}$ ;  $X_1, \cdots, X_{30}$  i.i.d. Gaussian random variables let's make an additional assumption to simplify the problem the standard deviation of  $X_i$   $\sigma = 0.6$  is known
- Step 4 Describe the parameter of interest and their estimates (10 secs): the mean value  $\mu_D$  and  $\hat{\mu}_D = \bar{x}$
- Step 5 Translate the "boring" statement into a statistical hypothesis and call it the **null hypothesis**  $H_0$  (10 secs):  $H_0: \mu_D = 2.1$

- Step 1 Make a "boring" statement (5 secs): drug D works the same as diet
- Step 2 Design an experiment (choose N = 30) (10 secs): let 30 chonker ducks take drug D and measure their weight loss after one month
- Step 3 Describe the data and random variables with assumptions about their distributions (5 secs): weight loss  $x_1, \cdots, x_{30}$ ;  $X_1, \cdots, X_{30}$  i.i.d. Gaussian random variables let's make an additional assumption to simplify the problem the standard deviation of  $X_i$   $\sigma = 0.6$  is known
- Step 4 Describe the parameter of interest and their estimates (10 secs): the mean value  $\mu_D$  and  $\hat{\mu}_D = \bar{x}$
- Step 5 Translate the "boring" statement into a statistical hypothesis and call it the **null hypothesis**  $H_0$  (10 secs):  $H_0: \mu_D=2.1$
- Step 6 Find the expression for the **test statistic** *s* (60 secs):

- Step 1 Make a "boring" statement (5 secs): drug D works the same as diet
- Step 2 Design an experiment (choose N = 30) (10 secs): let 30 chonker ducks take drug D and measure their weight loss after one month
- Step 3 Describe the data and random variables with assumptions about their distributions (5 secs): weight loss  $x_1, \cdots, x_{30}$ ;  $X_1, \cdots, X_{30}$  i.i.d. Gaussian random variables let's make an additional assumption to simplify the problem the standard deviation of  $X_i$   $\sigma = 0.6$  is known
- Step 4 Describe the parameter of interest and their estimates (10 secs): the mean value  $\mu_D$  and  $\hat{\mu}_D = \bar{x}$
- Step 5 Translate the "boring" statement into a statistical hypothesis and call it the **null hypothesis**  $H_0$  (10 secs):  $H_0: \mu_D=2.1$
- Step 6 Find the expression for the **test statistic** *s* (60 secs):

$$s = z = \frac{\bar{x} - 2.1}{\sigma\sqrt{30}}$$

Recall example: if you control the diet of your ducks, they lose 2.1 kg after one month on average. Company A has developed a drug D to help ducks lose weight. They claim that on average the drug works better than diet control. Here is the set up for the experiment.

- Step 1 Make a "boring" statement (5 secs): drug D works the same as diet
- Step 2 Design an experiment (choose N = 30) (10 secs): let 30 chonker ducks take drug D and measure their weight loss after one month
- Step 3 Describe the data and random variables with assumptions about their distributions (5 secs): weight loss  $x_1, \dots, x_{30}$ ;  $X_1, \dots, X_{30}$  i.i.d. Gaussian random variables let's make an additional assumption to simplify the problem the standard deviation of  $X_i$   $\sigma = 0.6$  is known
- Step 4 Describe the parameter of interest and their estimates (10 secs): the mean value  $\mu_D$  and  $\hat{\mu}_D = \bar{x}$
- Step 5 Translate the "boring" statement into a statistical hypothesis and call it the **null hypothesis**  $H_0$  (10 secs):  $H_0: \mu_D = 2.1$
- Step 6 Find the expression for the **test statistic** *s* (60 secs):

$$s = z = \frac{\bar{x} - 2.1}{\sigma\sqrt{30}}$$

Step 7 Find the expression for the **null distribution**  $f(s \mid H_0)$  (10 secs):

Recall example: if you control the diet of your ducks, they lose 2.1 kg after one month on average. Company A has developed a drug D to help ducks lose weight. They claim that on average the drug works better than diet control. Here is the set up for the experiment.

- Step 1 Make a "boring" statement (5 secs): drug D works the same as diet
- Step 2 Design an experiment (choose N = 30) (10 secs): let 30 chonker ducks take drug D and measure their weight loss after one month
- Step 3 Describe the data and random variables with assumptions about their distributions (5 secs): weight loss  $x_1, \cdots, x_{30}$ ;  $X_1, \cdots, X_{30}$  i.i.d. Gaussian random variables let's make an additional assumption to simplify the problem the standard deviation of  $X_i$   $\sigma = 0.6$  is known
- Step 4 Describe the parameter of interest and their estimates (10 secs): the mean value  $\mu_D$  and  $\hat{\mu}_D = \bar{x}$
- Step 5 Translate the "boring" statement into a statistical hypothesis and call it the **null hypothesis**  $H_0$  (10 secs):  $H_0: \mu_D = 2.1$
- Step 6 Find the expression for the **test statistic** *s* (60 secs):

$$s = z = \frac{\bar{x} - 2.1}{\sigma\sqrt{30}}$$

Step 7 Find the expression for the **null distribution**  $f(s \mid H_0)$  (10 secs):

$$f(z\mid H_0) = \frac{1}{\sqrt{2\pi}}e^{-\frac{x^2}{2}}$$

Step 8 Define an alternative hypothesis  $H_A$  (10 secs):

Step 8 Define an alternative hypothesis  $H_A$  (10 secs):

$$H_A: \mu_D \neq 2.1 \text{ or } H_A: \mu_D > 2.1$$

Step 8 Define an alternative hypothesis  $H_A$  (10 secs):

$$H_A: \mu_D \neq 2.1 \text{ or } H_A: \mu_D > 2.1$$

Step 8 Define an alternative hypothesis  $H_A$  (10 secs):

$$H_A: \mu_D \neq 2.1 \text{ or } H_A: \mu_D > 2.1$$

One-tailed or two-tailed

Two-tailed (5 secs):

Step 8 Define an alternative hypothesis  $H_A$  (10 secs):

$$H_A: \mu_D \neq 2.1 \text{ or } H_A: \mu_D > 2.1$$

One-tailed or two-tailed

• Two-tailed (5 secs):  $H_A: \mu_D \neq 2.1$ 

Step 8 Define an alternative hypothesis  $H_A$  (10 secs):

$$H_A: \mu_D \neq 2.1 \text{ or } H_A: \mu_D > 2.1$$

- Two-tailed (5 secs):  $H_A: \mu_D \neq 2.1$
- One-tailed (5 secs):

Step 8 Define an alternative hypothesis  $H_A$  (10 secs):

$$H_A: \mu_D \neq 2.1 \text{ or } H_A: \mu_D > 2.1$$

- Two-tailed (5 secs):  $H_A: \mu_D \neq 2.1$
- One-tailed (5 secs):  $H_A: \mu_D > 2.1$

Step 8 Define an alternative hypothesis  $H_A$  (10 secs):

$$H_A: \mu_D \neq 2.1 \text{ or } H_A: \mu_D > 2.1$$

- Two-tailed (5 secs):  $H_A: \mu_D \neq 2.1$
- One-tailed (5 secs):  $H_A: \mu_D > 2.1$
- Step 9 Choose a significance level  $\alpha$  (the tail), which defines the rejection region (5 secs):

Step 8 Define an alternative hypothesis  $H_A$  (10 secs):

$$H_A: \mu_D \neq 2.1 \text{ or } H_A: \mu_D > 2.1$$

- Two-tailed (5 secs):  $H_A: \mu_D \neq 2.1$
- $\bullet$  One-tailed (5 secs):  $\textit{H}_{\textit{A}}: \mu_{\textit{D}} > 2.1$
- Step 9 Choose a significance level  $\alpha$  (the tail), which defines the rejection region (5 secs): e.g.  $\alpha=0.05$

Step 8 Define an alternative hypothesis  $H_A$  (10 secs):

$$H_A: \mu_D \neq 2.1 \text{ or } H_A: \mu_D > 2.1$$

- Two-tailed (5 secs):  $H_A: \mu_D \neq 2.1$
- One-tailed (5 secs):  $H_A: \mu_D > 2.1$
- Step 9 Choose a significance level  $\alpha$  (the tail), which defines the rejection region (5 secs): e.g.  $\alpha=0.05$
- Step 10 Collect 30 ducks in 20 secs and feed them drugs

Step 8 Define an alternative hypothesis  $H_A$  (10 secs):

$$H_A: \mu_D \neq 2.1 \text{ or } H_A: \mu_D > 2.1$$

- Two-tailed (5 secs):  $H_A: \mu_D \neq 2.1$
- One-tailed (5 secs):  $H_A: \mu_D > 2.1$
- Step 9 Choose a significance level  $\alpha$  (the tail), which defines the rejection region (5 secs): e.g.  $\alpha=0.05$
- Step 10 Collect 30 ducks in 20 secs and feed them drugs great job! Weights measured after one month  $x_1,\cdots,x_{30}$

Step 8 Define an alternative hypothesis  $H_A$  (10 secs):

$$H_A: \mu_D \neq 2.1 \text{ or } H_A: \mu_D > 2.1$$

- Two-tailed (5 secs):  $H_A: \mu_D \neq 2.1$
- One-tailed (5 secs):  $H_A: \mu_D > 2.1$
- Step 9 Choose a significance level  $\alpha$  (the tail), which defines the rejection region (5 secs): e.g.  $\alpha=0.05$
- Step 10 Collect 30 ducks in 20 secs and feed them drugs great job! Weights measured after one month  $x_1,\cdots,x_{30}$ 
  - Say  $\frac{1}{30} \sum_{i=1}^{30} x_i = 2.2$
- Step 11 Compute the test statistic from data (5 secs):

Step 8 Define an alternative hypothesis  $H_A$  (10 secs):

$$H_A: \mu_D \neq 2.1 \text{ or } H_A: \mu_D > 2.1$$

- Two-tailed (5 secs):  $H_A: \mu_D \neq 2.1$
- One-tailed (5 secs):  $H_A: \mu_D > 2.1$
- Step 9 Choose a significance level  $\alpha$  (the tail), which defines the rejection region (5 secs): e.g.  $\alpha=0.05$
- Step 10 Collect 30 ducks in 20 secs and feed them drugs great job! Weights measured after one month  $x_1, \dots, x_{30}$ 
  - Say  $\frac{1}{30} \sum_{i=1}^{30} x_i = 2.2$
- Step 11 Compute the test statistic from data (5 secs):

$$z_0 = \frac{2.2 - 2.1}{0.6/\sqrt{30}} = 0.91$$

Step 12 Compute the *p*-value (20 secs):

• For  $H_A: \mu_D > 2.1$  (one-tailed):  $p = P(Z \ge z_0 \mid H_0) = 0.1807 > \alpha$ 

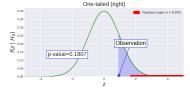

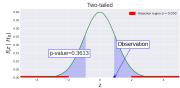

- For  $H_A: \mu_D > 2.1$  (one-tailed):  $p = P(Z \ge z_0 \mid H_0) = 0.1807 > \alpha$
- For  $H_A: \mu_D \neq 2.1$  (two-tailed):  $p = 2P(Z \geq z_0 \mid H_0) = 0.3613 > \alpha$

- Step 12 Compute the *p*-value (20 secs):
  - For  $H_A: \mu_D > 2.1$  (one-tailed):  $p = P(Z \ge z_0 \mid H_0) = 0.1807 > \alpha$
  - For  $H_A: \mu_D \neq 2.1$  (two-tailed):  $p = 2P(Z \geq z_0 \mid H_0) = 0.3613 > \alpha$
- Step 13 If p-value<  $\alpha$ , i.e. the test statistic falls in the rejection region of the null distribution, then we reject the hypothesis  $H_0$

Do not reject  $H_0$  for both one-tailed and two-tailed  $H_A$ 

What if  $\bar{x} = 2.3$ ?

What if  $\bar{x} = 2.3$ ?

Step 11 Compute the test statistic from data (5 secs):

What if  $\bar{x} = 2.3$ ?

Step 11 Compute the test statistic from data (5 secs):

$$z_0 = \frac{2.3 - 2.1}{0.6/\sqrt{30}} = 1.826$$

What if  $\bar{x} = 2.3$ ?

Step 11 Compute the test statistic from data (5 secs):

$$z_0 = \frac{2.3 - 2.1}{0.6/\sqrt{30}} = 1.826$$

What if  $\bar{x} = 2.3$ ?

Step 11 Compute the test statistic from data (5 secs):

$$z_0 = \frac{2.3 - 2.1}{0.6/\sqrt{30}} = 1.826$$

- For  $H_A: \mu_D > 2.1$  (one-tailed):  $p = P(Z \ge z_0 \mid H_0) = 0.0339 < \alpha$
- For  $H_A: \mu_D \neq 2.1$  (two-tailed):  $p = 2P(Z \geq z_0 \mid H_0) = 0.0679 > \alpha$

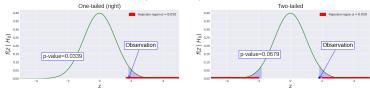

What if  $\bar{x} = 2.3$ ?

Step 11 Compute the test statistic from data (5 secs):

$$z_0 = \frac{2.3 - 2.1}{0.6/\sqrt{30}} = 1.826$$

- For  $H_A: \mu_D > 2.1$  (one-tailed):  $p = P(Z \ge z_0 \mid H_0) = 0.0339 < \alpha$
- For  $H_A: \mu_D \neq 2.1$  (two-tailed):  $p = 2P(Z \geq z_0 \mid H_0) = 0.0679 > \alpha$

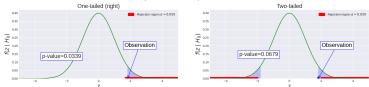

Step 13 If p-value  $< \alpha$ , i.e. the test statistic falls in the rejection region of the null distribution, then we reject the hypothesis  $H_0$ 

Reject  $H_0$  for one-tailed  $H_A$ ; do not reject  $H_0$  for two-tailed  $H_A$  for the same confidence level  $1 - \alpha = 5\%$ 

Step 13 If p-value  $< \alpha$ , i.e. the test statistic falls in the rejection region of the null distribution, then we reject the hypothesis  $H_0$ 

Reject  $H_0$  for one-tailed  $H_A$ ; do not reject  $H_0$  for two-tailed  $H_A$  for the same confidence level  $1 - \alpha = 5\%$ 

Note: the two-tailed test is more conservative - if the data passes a two-tailed test, it is more conclusive than one-tailed test for the same confidence level

What if  $\bar{x} = 2.3$  with N = 100?

What if  $\bar{x} = 2.3$  with N = 100?

Step 11 Compute the test statistic from data (5 secs):

What if  $\bar{x} = 2.3$  with N = 100?

Step 11 Compute the test statistic from data (5 secs):

$$z_0 = \frac{2.3 - 2.1}{0.6 / \sqrt{100}} = 3.33$$

What if  $\bar{x} = 2.3$  with N = 100?

Step 11 Compute the test statistic from data (5 secs):

$$z_0 = \frac{2.3 - 2.1}{0.6 / \sqrt{100}} = 3.33$$

What if  $\bar{x} = 2.3$  with N = 100?

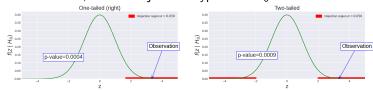

Step 11 Compute the test statistic from data (5 secs):

$$z_0 = \frac{2.3 - 2.1}{0.6/\sqrt{100}} = 3.33$$

- For  $H_{A}: \mu_{D} > 2.1$  (one-tailed):  $p = P(Z \ge z_0 \mid H_0) = 0.0004 < \alpha$
- For  $H_A: \mu_D \neq 2.1$  (two-tailed):  $p = 2P(Z \geq z_0 \mid H_0) = 0.0009 < \alpha$

Step 13 If p-value  $< \alpha$ , i.e. the test statistic falls in the rejection region of the null distribution, then we reject the hypothesis  $H_0$ 

Reject  $H_0$  for both one-tailed and two-tailed  $H_A$ 

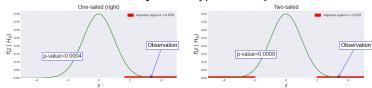

### Note:

• With more data, it becomes more certain that we should reject  $H_0$  in favor of  $H_A$  given the observation  $\bar{x} = 2.3$ 

Step 13 If p-value  $< \alpha$ , i.e. the test statistic falls in the rejection region of the null distribution, then we reject the hypothesis  $H_0$ 

Reject  $H_0$  for both one-tailed and two-tailed  $H_A$ 

#### Note:

• With more data, it becomes more certain that we should reject  $H_0$  in favor of  $H_A$  given the observation  $\bar{x} = 2.3$ 

This test is called one-sample z-test

### Summary

#### So far:

- Data types and data containers
- Descriptive data analysis: descriptive statistics, visualization
- Probability distributions, events, random variables, PMF, PDF, parameters
- CDF, Q-Q plot, how to compare two distributions (data vs theoretical, data vs data)
- Modeling
- Parameter estimation: maximum likelihood estimation (MLE) and maximum a posteriori estimation (MAP)
- Classification, multinomial naive Bayes classifier, Gaussian naive Bayes classifier
- Central limit theorem, interval estimation
- Hypothesis test

### Summary

#### So far:

- Data types and data containers
- Descriptive data analysis: descriptive statistics, visualization
- Probability distributions, events, random variables, PMF, PDF, parameters
- CDF, Q-Q plot, how to compare two distributions (data vs theoretical, data vs data)
- Modeling
- Parameter estimation: maximum likelihood estimation (MLE) and maximum a posteriori estimation (MAP)
- Classification, multinomial naive Bayes classifier, Gaussian naive Bayes classifier
- Central limit theorem, interval estimation
- Hypothesis test

#### Next:

• More examples, test statistics; comparison of two classifiers

### Summary
